Supporting Ground Source Heat Pumps with Jtech Services

As Ground Source Heat Pumps gain traction in large-scale heating projects, there arises a corresponding demand for new ancillary support systems. Recently, Jtech Services contributed to such a scenario in multiple projects across West London. These projects necessitated a robust support structure not only to secure the new water tank above the heat pump but also to facilitate easier pipework installation.

In the past, a makeshift timber structure might have sufficed for such needs. However, the installer prioritised longevity and ease of installation for the new heating infrastructure. Collaborating with Jtech Services, a heavy-duty support system was meticulously designed and rigorously tested to meet the required loadings.

Upon approval, Jtech Services leveraged their extensive fabrication expertise to seamlessly manufacture and supply the support system, tailored to the site's scheduling requirements.
