Jtech Services enhances heavy duty radiator guard lineup

In conversations with their clients, Jtech Services has discovered that not all applications necessitate identical levels of protection. Consequently, depending on the specific site applications, Jtech Services has the capability to adjust the level of protection provided by their guards to accommodate on-site conditions.

This adaptability may involve the utilization of thicker gauge steel or the integration of specially designed internal bracing. In all cases, the objective is to ensure that the guards possess the required robustness for the given situation.

The guards still retain convenient features, such as front-opening access panels equipped with Jtech Services' SKS locking mechanism, facilitating authorized access, maintenance, and cleaning throughout their extended service life. Jtech Services acknowledges that these unique circumstances may arise infrequently, and they want to assure their clients that they are fully prepared to meet these 'special' requirements, even if they are one-time occurrences.

It is important to note that in addition to their standard white powder coat finish, Jtech Services offers their guards in a variety of other colours to harmonize with either new or existing decor or to align with DDA requirements.

To complement the guards, the Jtech Pipe Boxing range includes a sturdy powder-coated Metal Pipe Boxing system that can also be vented to match the Radiator Guards seamlessly.
