Elevate your build with timber from Tailor Made Designs

For over 10,000 years, timber has been used as a reliable building material. Explore the longevity, sustainability, and versatility of wood with these compelling reasons to make it your primary choice:

Long-Lasting Brilliance: When cared for, timber structures stand strong for years. Like any investment, wood needs a bit of TLC to ensure enduring reliability.

Renewability Matters: Opt for timber as a renewable resource, unlike concrete and steel. Timber is environmentally friendly, with timber suppliers often planting two trees for every one felled.

Easy on the Environment: The timber's manufacturing process is eco-friendly, utilizing waste as biomass. At the end of its life, wood effortlessly deconstructs, biodegrades, or finds new purpose, unlike non-renewable concrete.

Hassle-Free Installation: Lightweight and often installable by hand, timber makes construction more accessible and practical, whether for a garage or a carport.

Natural Insulation Bonus: Enjoy natural insulation with timber, which boasts 10 times the insulating capabilities of concrete. Combine with quality insulation for energy-efficient homes.

Reducing Overall Mass: Timber minimizes a project's overall mass, reducing the need for excessive concrete, or even allowing for additional stories in your build.
