Vortice supplies energy efficient ventilation solution to former convent

The large range of Vortice ventilation systems meant specifiers were able to find the right solution when faced with the many design issues involved in converting a former convent into luxury homes.

Poor Clare's had been an active convent in the Warwickshire village of Baddesley Clinton for 160 years before it closed. After standing empty for some time, a plan was drawn up for a development of 18 high specification homes.

The 19th century building was to retain many of its historic aspects during the conversion so the main issue for Vortice and the contractor Sands, was to protect and maintain the look of the façade.

The Vort Leto centralised unit was the ideal choice. This ventilation unit allowed for one extract point only out of the building and its continuously running system boosts up via switches located locally to the wet rooms.
